USER GUIDE · V1.0

Shopify Connector Setup & Publishing Guide

Connect your Vexa PIM to Shopify in minutes using a custom app token, then publish products directly from PIM to your store.

Vexa PIM · Shopify Integration · May 2026

Before You Begin — Prerequisites

- ✓ Admin or Manager role in Vexa PIM
- ✓ Custom app created in Shopify Admin
- ✓ At least one sales channel / publication in Shopify
- ✓ Shopify store with Admin access
- ✓ Admin API Access Token (SHPAT) from that app
- ✓ Products in *Approved* or *In Review* status in PIM

PHASE 1 — INSTALL THE CONNECTOR

1

Shopify Admin

Create a Custom App in Shopify

In Shopify Admin, go to **Apps** → **Develop apps** → **Create an app**. Give it a name (e.g. *Vexa PIM*). Under **Configuration** → **Admin API access scopes**, enable at minimum: `read_products`, `write_products`, `read_publications`, `write_publications`.

i You only need to create this custom app once per Shopify store.

2

Shopify Admin

Generate the Admin API Access Token (SHPAT)

Inside your new app, click **API credentials** → **Install app**. After installation, click **Reveal token once** under *Admin API access token*. Copy the token — it starts with `shpat_`.

⚠ Shopify shows this token only once. Store it in a password manager before leaving the page.

3

Vexa PIM

Open the Connector Setup Page

In Vexa PIM, navigate to **Channels** → **Connectors** in the left sidebar. Find the *Shopify* tile and click **Set Up** (or **Install**). You will land on the connector setup form.

4

Vexa PIM

Enter an Account Alias

In the **Account Alias** field, type a short, human-readable name for this Shopify store (e.g. `main-store` or `vishaltest112`). This label appears in connector lists and export history.

i Use lowercase letters, numbers, and hyphens only. Avoid spaces.

5

Vexa PIM

Enter Your Store Domain

In the **Store Domain** field, type your Shopify store's myshopify domain, e.g. `your-store.myshopify.com`. Do not include `https://` — just the hostname.

6

Vexa PIM

Paste the Admin API Access Token (SHPAT)

In the **Admin API Access Token (SHPAT)** field, paste the `shpat_…` token you copied in Step 2. The field is masked for security. Leave the *Client ID* field blank — it is only needed for managed OAuth installs.

✅ Providing the SHPAT completes authorization immediately — no OAuth redirect required.

7

Vexa PIM

Submit the Setup Form

Click **Install Connector** (or **Save**). Vexa PIM sends the credentials to the API, creates the installation record, and calls back Shopify to validate the token. On success you are redirected to the connector's **Overview** tab.

⚠️ If you see an error, double-check that the store domain matches the store where you created the custom app, and that the SHPAT was copied in full.

PHASE 2 — VERIFY & CONFIGURE

1

Verify

Confirm Connection on the Overview Tab

On the connector **Overview** tab, confirm that **no amber warning banner** appears at the top of the page. A warning banner means OAuth has not been finalized — go back to Step 6 and re-enter the SHPAT. If the page is clean, the connector is fully authorized.

2

Vexa PIM

Open the Credentials Tab

Click the **Credentials** tab. This tab performs a live fetch of your Shopify publication channels each time it loads. Wait a moment for the list to populate.

ℹ️ If no channels appear, reload the page. The tab header reads *Reload to refetch channels →* — click it to trigger a fresh fetch from Shopify.

3

Vexa PIM

Select a Publication Target

From the list of channels fetched from Shopify (e.g. *Online Store*, *Point of Sale*), tick the checkbox next to the channel you want to publish products to. Click **Save publication targets**. The selected channel will be shown with a *selected* chip.

✅ Your connector is now fully configured and ready to receive product exports.

PHASE 3 — PUBLISH A PRODUCT

1

Publishing

Open a Product in Vexa PIM

Navigate to **Products** in the sidebar. Find a product in *Approved* or *In Review* status. Click its title to open the product detail page.

2

Publishing

Check the Quality Tab

Click the **Quality** tab. Review the *Compliance Validation* section. Ensure there are zero **blocking errors** for Shopify. Warnings are informational and do not prevent publishing.

ℹ Common blocking issues: missing primary HTTPS image (`mainImageUrl`), missing title, missing SKU. Fix these before proceeding.

3

Publishing

Trigger a Shopify Export Job

On the product detail page, click **Export to Shopify** (or the channel publish button). Confirm the target connector shows the alias you set up (e.g. `main-store`). Click **Submit**. A job is queued immediately.

4

Verify

Monitor the Export Job

The job status transitions: `QUEUED` → `PROCESSING` → `SUCCESS` (or `ERROR`). You can watch progress in the **Submission History** panel on the product page or in **Jobs** from the sidebar. Processing typically completes within 10–30 seconds.

⚠ If the status is `ERROR` , click the job row to see the full error message. Common causes: zero selling price, duplicate SKU in Shopify, or rate-limit retry in progress.

5

Verify

Confirm the Product in Shopify Admin

In **Shopify Admin** → **Products**, search for the product by title or handle. Confirm:

• Status is **Active** · Correct price and SKU · Published to your chosen channel · Primary image present

Your product is live in Shopify. Repeat Steps 11–15 for each product, or use Bulk Edit to queue multiple exports at once.
